

What format does the Department require for hyperspectral data?

Hyperspectral data is required to be submitted as reflectance-level data with all associated geocorrection files. In this form, the data has the full 125/128 bands while using minimum disk space, and will allow reprocessing in the future. Reflectance data should be submitted as .bil files, with accompanying .hdr header files and corresponding geocorrection information in .img and .glt files. Data older than 2004 may lack the .glt files or be at radiance level rather than reflectance. Mineral maps are also to be presented. All images need to be georeferenced. Data should be supplied to the Department on archival quality gold DVDs or a non-returnable portable hard disc compatible with the windows operating system.
