

Daly River Bridge and approaches

Details of work

A new single lane bridge will be built across the Daly River, downstream of the existing crossing. The bridge will be approximately 184 metres long and will include a pedestrian walkway.

The project includes 2 km of new road embankment connecting the bridge to the existing Daly River and Port Keats Roads, and allows for widening of the bridge to two lanes in the future.

Artist's impression of new Daly River Bridge

Benefits

- The new bridge will improve traffic flow.
- Reduce road closures during the wet season.

Commencement of works

Work expected to begin in the 2011 dry season.

Improving drainage

Further drainage works will be undertaken on the Daly River Road near Tommy's Creek to direct storm water away from the communities.

Impacts during construction

- The new bridge is downstream of the existing crossing (see map overleaf) which will minimise impacts on traffic during construction.
- Some disruption should be expected to the existing Daly River Road and Port Keats Road during intersection works.
- The existing crossing will remain open during construction.
- A section of the river will be closed upstream and downstream of the new bridge during construction.
